Assessment of the Physical Fitness Level

1/8/2026 3:50:28 PM

Assessment of the transition period

Min HR - 77

Max HR - 89

Chronotropic reaction HR (supine) / Max HR	0.75
Compensation response Min HR / Max HR	0.86
Ortho-Test Ratio RR average Supine vs RR average Upright	1.16

Conclusion :

CHRONOTROPIC REACTION DECREASES MODERATELY IN RESPONSE TO ORTHOTEST WHILE VASCULAR COMPENSATION IS ABSENT

Interpretation of ANS assessment based on Heart Rate Variability

1/8/2026 3:50:28 PM

Orthotest	Valsalva Maneuver combined with Deep Breathing
Autonomic Nervous system activity is within the negative PSNS zone.	Deep breathing vs. Normal breathing slightly elevates the Parasympathetic activity. Deep breathing vs. Normal breathing slightly elevates the Sympathetic activity. Valsalva ratio is on an average level.

Summary

Valsalva maneuver combined with Deep breathing shows a slight reserve of the Sympathoadrenergic function.
Baroreceptors sensitivity is on an average level.
Valsalva test compared with Orthostatic test shows a slight improvement of the Parasympathetic function.
There is a slightly decreased level of adaptability
There is a possibility of the beginning stage of some chronic problems.

* Final decision can be made ONLY by combining ANS assessment conclusions with clinical data!
