Interpretation of ANS assessment based on Heart Rate Variability

12/29/2025 9:06:46 AM

Orthotest	Valsalva Maneuver combined with Deep Breathing
Autonomic Nervous system activity is within the negative PSNS zone. There is a mild Sympathetic Hyper-Regulation in response to the orthostatic intervention.	**Deep breathing vs. Normal breathing slightly elevates the Sympathetic activity. Deep breathing vs. Normal breathing shows no changes by the Parasympathetic activity. Valsalva ratio is on a high level.**

Summary

Valsalva maneuver combined with Deep breathing shows a slight reserve of the Sympathoadrenergic function.
Baroreceptors sensitivity is on a high level.
There is a slightly decreased level of adaptability
There is a possibility of the beginning stage of some chronic problems.

* **Final decision can be made ONLY by combining ANS assessment conclusions with clinical data!**
