Interpretation of ANS assessment based on Heart Rate Variability

1/5/2026 10:27:15 AM

Orthotest	Valsalva Maneuver combined with Deep Breathing
Autonomic Nervous system activity is within the negative PSNS zone. There is a mild Sympathetic Hyper-Regulation in response to the orthostatic intervention.	Deep breathing vs. Normal breathing shows no improvement by the Parasympathetic activity.

Summary

There is an evidence of significantly decreased sensitivity of Parasympathetic receptors.
There is a significantly decreased level of adaptability
There is a possibility of some chronic problems.

* Final decision can be made ONLY by combining ANS assessment conclusions with clinical data!
