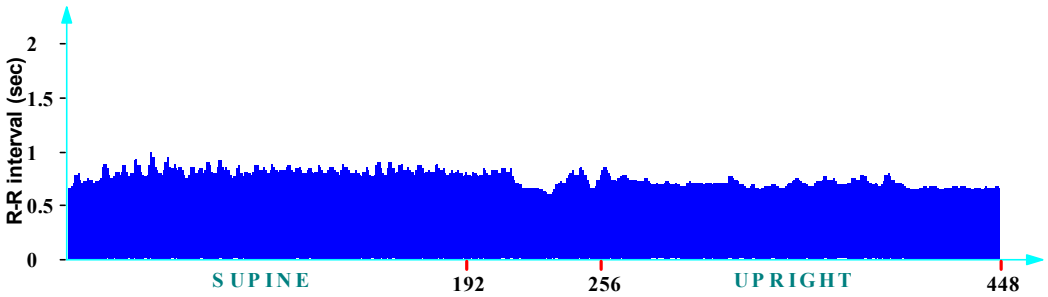
# Assessment of the Physical Fitness Level

**12/29/2025 9:01:01 AM**



## Assessment of the transition period

Min HR - 69

Max HR - 99

| | |
|---|---|
| **Chronotropic reaction**<br>HR (supine) / Max HR | 0.72 |
| **Compensation response**<br>Min HR / Max HR | 0.77 |
| **Ortho-Test Ratio**<br>RR average Supine vs RR average Upright | 1.19 |

## Conclusion :

CHRONOTROPIC REACTION DECREASES MODERATELY IN RESPONSE TO ORTHOTEST WHILE VASCULAR COMPENSATION DECREASES SIGNIFICANTLY

# *Interpretation of ANS assessment based on Heart Rate Variability*

12/29/2025 9:01:01 AM

| Orthotest | Valsalva Maneuver combined with Deep Breathing |
|---|---|
| Autonomic Nervous system activity is within the negative PSNS zone.<br>There is a mild Sympathetic Hyper-Regulation in response to the orthostatic intervention. | Deep breathing vs. Normal breathing slightly elevates the Sympathetic activity.<br>Deep breathing vs. Normal breathing shows no changes by the Parasympathetic activity.<br>Valsalva ratio is on a high level. |

## Summary

Valsalva maneuver combined with Deep breathing shows a slight reserve of the Sympathoadrenergic function.
Baroreceptors sensitivity is on a high level.
There is a slightly decreased level of adaptability
There is a possibility of the beginning stage of some chronic problems.

* Final decision can be made ONLY by combining ANS assessment conclusions with clinical data!
